DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

- (e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.
- 2. Claim 1 is rejected under 35 U.S.C. 102(e) as being anticipated by Li et al (US 6,219,793).
 - a. <u>Referring to claim 1:</u>
 - Li teaches:

(1) storing biometric data in dependence upon a biometric characteristic of a first designated user of the secure entity or service other than the third party; capturing biometric information representative of a biometric characteristic and providing biometric data in dependence thereupon; comparing the captured biometric data with the stored biometric data to produce a comparison result; and, if the comparison result is indicative of a match: providing a wireless gating signal for enabling wireless signals provided by the third party to access the secure entity or service [i.e., an authentication method implemented on the central authentication node may be characterized by the following sequence: (a) determining that the call has been initiated from a source; (b) determining whether source fingerprint data provided from the source matches stored fingerprint data associated with the source; and (c) if the source fingerprint data matches the stored fingerprint data, allowing the call to be completed. Matching may involve separate matching steps at both the source and the central authentication node. It may also involve decrypting a challenge. In addition to the above basic steps, the authentication

Page 3

Application/Control Number: 09/863,301

Art Unit: 2135

node may request that the source fingerprint data be provided from the source of the call (column 3, lines 20-40, also refer to Figure 1 and column 6, lines 52-67 through column 7, lines 1-5)].

Claim Rejections - 35 USC § 103

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 4. Claims 2-20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Li et al (US 6,219,793), and further in view of Diamant et al (US 5,969,632).

a. Referring to claim 2:

- i. Li teaches:
- service; in response to the wireless gating signal, setting a flag within the secure entity or service, the flag for use in gating received wireless signals for controlling access to the secure entity or service such that in a first state the secure entity or service is non responsive to the wireless signals and in a second other state the secure entity or service is responsive to the wireless signals provided by the third party [i.e., these limitations discloses in column 4, lines 6-20].
- ii. Though Li is silent about setting a flag within the Central Authentication System (CAS) as shown in Figure 1, element 106, Diamant teaches:
- (1) referring to Figure 8, steps 500 and 506 disclose the device sets a security flag to on and off (column 13, lines 21-42).
- iii. It would have been obvious to a person having ordinary skill in the art at the time the invention was made to:
- (1) have applied the teaching of Diamant into the teaching of Li's CAS to securing access to data and devices when in communication over a network (column 1, lines 22-23 of Diamant).

Art Unit: 2135

iv. The ordinary skilled person would have been motivated to:

(1) have applied the teaching of Diamant into the teaching of Li's CAS since computers which are connected to WAN or LAN communication networks are vulnerable to hostile intrusion by unauthorized persons or data viruses which attempt to access classified files, download them and "crack" their encryption (column 1, lines 15-18 of Diamant).

b. Referring to claim 3:

- i. Diamant further teaches:
- (1) wherein the flag is returned to the first state after a predetermined amount of time [i.e., referring to Figure 8, steps 500 and 506 disclose the device sets a security flag to on and off (column 13, lines 21-42)].

c. Referring to claim 4:

i. This claim has limitations that is similar to those of claims 1 and 2, thus it is rejected with the same rationale applied against claims 1 and 2 above.

d. Referring to claim 5:

i. This claim has limitations that is similar to those of claim 4, thus it is rejected with the same rationale applied against claim 4 above.

e. Referring to claim 6, 13:

i. These claims have limitations that is similar to those of claim2, thus they are rejected with the same rationale applied against claim 2 above.

f. Referring to claim 7:

- i. Li further teaches:
- (1) wherein the third party comprises a plurality of persons [i.e., multiple users can be permitted to use the same wireless phone (column 15, lines 16-17)].

g. Referring to claim 8:

- i. Li further teaches:
- (1) wherein different persons of the plurality of persons have different predetermined access privileges [i.e., all that is required is that the MCKD 107 at the CAS 106 be allowed to contain multiple CKs 202, one generated

Art Unit: 2135

from each user of the same phone. Such authorization can in principle be activated/initiated by the phone owner serving as a master user who can at any time recruit additional users to be able to use their phone. By activating appropriate buttons on the phone, the master user can in principle activate the phone and the CAS 106 to receive a newly recruited user's fingerprint for association with the master user's entry in the MCKD 107. The master user can remotely authorize this action by simply validating it with his/her fingerprint. Again by engaging a pre-defined sequence of buttons on the phone the master user could also in principle remove previously authorized co-users (column 15, lines 17-30)].

h. Referring to claims 9-10:

i. These claims have limitations that is similar to those of claim8, thus they are rejected with the same rationale applied against claim 8 above.

i. Referring to claims 11-12:

i. These claims consist a method for providing gated access for a third party to a secure entity or service to implement claim 4 and is rejected by the same prior art of record.

j. Referring to claim 14:

i. Li further teaches:

(1) wherein the wireless gating signal from the first portable biometric device and the wireless signal from the second portable biometric device are received at different ports of the secure entity or service [i.e., CAS 106 must be able to handle, simultaneously, many calls from many wireless carriers (column 14, lines 44-45)].

k. Referring to claim 15:

Li further teaches:

(1) a biometric sensor for capturing biometric information representative of a biometric characteristic in response to a person presenting said information to the portable biometric device [i.e., Figure 1 shows an apparatus that may be used to process a wireless call in accordance with the principles of the

Art Unit: 2135

current invention. A fingerprint capturing device ("FCPD") 101 with an on-board CPU for processing and comparison of the captured fingerprint image (see Figure 4) is connected to the wireless telephone 102 (column 6, lines 52-59)];

- (2) an encoder for digitally encoding the captured biometric information and providing biometric data in dependence thereupon [i.e., CAS is for encrypting a challenge with the stored fingerprint data to produce an encrypted challenge (column 3, lines 48-49)];
- biometric characteristic of a first designated user; a processor for comparing the captured biometric data with stored biometric data to produce a comparison result, and if the comparison result is indicative of the first designated user for providing a wireless gating signal for enabling wireless signals provided by the third party to access the secure entity or service, and if the comparison result is indicative of the third party for providing a wireless signa [i.e., referring to Figure 1, element 101 disclose a fingerprint capturing module with processing and memory unit (column 7, lines 38-55)]; and,
- (4) a transmitter for wireless transmission of the wireless gating signal or the wireless signal; at least a port for receiving the wireless gating signal and the wireless signal from the portable biometric device [i.e., the connection may be by any method, i.e. via a telephone modem or a data port specifically built-in to the wireless telephone 102, an acoustic coupler, or the direct incorporation of the fingerprint module 101 into the wireless telephone 102 (column 6, lines 59-63)]; and,
- (5) a locking mechanism for securing the entity or service, the locking mechanism comprising a processor for setting a flag in response to the wireless gating signal, the flag for use in gating received wireless signals for controlling access to the secure entity or service such that in a first state the locking mechanism is non responsive to the wireless signals and in a second other state the locking mechanism is responsive to the wireless signals provided by the third party [i.e.,

Art Unit: 2135

referring to Figure 1 again, element 106, Central Authentication System (CAS) is for authenticating and/or securing the security data].

- ii. Though Li is silent about setting a flag within the Central Authentication System (CAS) as shown in Figure 1, element 106, Diamant teaches:
- (1) referring to Figure 8, steps 500 and 506 disclose the device sets a security flag to on and off (column 13, lines 21-42).
- iii. It would have been obvious to a person having ordinary skill in the art at the time the invention was made to:
- (1) have applied the teaching of Diamant into the teaching of Li's CAS to securing access to data and devices when in communication over a network (column 1, lines 22-23 of Diamant).
 - iv. The ordinary skilled person would have been motivated to:
- (1) have applied the teaching of Diamant into the teaching of Li's CAS since computers which are connected to WAN or LAN communication networks are vulnerable to hostile intrusion by unauthorized persons or data viruses which attempt to access classified files, download them and "crack" their encryption (column 1, lines 15-18 of Diamant).

I. Referring to claim 16:

- i. Li further teaches:
- (1) wherein the portable biometric device comprises memory for storing biometric data indicative of a biometric characteristic of the third party [i.e., referring to Figure 1, element 102 include storage for storing user's fingerprint that is sent from device 101].

m. Referring to claim 17:

i. This claim has limitations that is similar to those of claim 14, thus it is rejected with the same rationale applied against claim 14 above.

n. Referring to claims 18-20:

i. These claims consist a security system for securing an entity or a service from indiscriminate access to implement claim 15 and is rejected by the same prior art of record.

Art Unit: 2135

Conclusion

5. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

a. Fishbine et al (US 5, 467, 403) discloses a portable and lightweight fingerprint scanning apparatus which can optically scan and record fingerprint images in the field and transmit said images to a mobile unit for processing and subsequent wireless transmission to a central location for the purpose of providing immediate identity and background checks on the individual being fingerprinted (see abstract).

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Thanhnga (Tanya) Truong whose telephone number is 571-272-3858.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Kim Vu can be reached at 571-272-3859. The fax and phone numbers for the organization where this application or proceeding is assigned is 703-872-9306.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is 571-272-2100.
